Contents

1	**Company Overview**	The post-commissioning challenge and the Solserva solution
2	**Platform at a Glance**	Five integrated modules on one platform
3	**Module Specifications**	Detailed capabilities of Modules 1 to 5
4	**Subscription Plans**	Pilot, Starter, Growth and Enterprise tiers
5	**Technology Roadmap**	Upcoming modules and integrations
6	**Value for Every Stakeholder**	Benefits for owners, managers and end-customers
7	**Contact Us**	Start your pilot with Solserva

About this catalogue

This catalogue describes the Solserva platform for managing the complete after-sales lifecycle of solar assets: service requests, field operations, AMC (Annual Maintenance Contract) renewals and digital service reporting.

Abbreviations used: EPC – Engineering, Procurement & Construction; O&M – Operations & Maintenance; AMC – Annual Maintenance Contract; SLA – Service Level Agreement; C&I – Commercial & Industrial; SLD – Single-Line Diagram; DSR – Digital Service Report; PM – Preventive Maintenance; RBAC – Role-Based Access Control; QR – Quick Response; SaaS – Software as a Service; B2B – Business-to-Business; CRM – Customer Relationship Management; API – Application Programming Interface; IoT – Internet of Things; BI – Business Intelligence; SMS – Short Message Service.

1 Company Overview

The Post-Commissioning Challenge

For decades, the solar industry has focused on the pre-commissioning phase: procuring modules, designing layouts and executing installations. Yet long-term profitability and brand reputation are won or lost after commissioning, across the many years a plant must be serviced, maintained and kept generating.

Conventional after-sales operations suffer from four structural inefficiencies:

- **Fragmented communication –** complaints arrive through WhatsApp messages, calls to individual technicians and scattered emails, so tickets are lost or forgotten.
- **Revenue leakage –** AMCs are tracked on spreadsheets or sticky notes, so renewal windows are missed and high-margin recurring revenue is lost.
- **Operational blind spots –** owners have no visibility of technician productivity, average resolution times or the service history of each customer rooftop.
- **Customer friction –** end-users must download apps, remember passwords or navigate complex portals simply to report an inverter error or grid failure.

The Solserva Solution

Solserva Greentech Private Limited offers an enterprise-grade B2B SaaS platform built specifically to digitise, automate and scale post-sales operations for Solar EPC companies, O&M contractors and field service enterprises. As a single source of truth, it connects the back office, field engineers and end-customers — turning after-sales service from a cost centre into a predictable profit engine.

2 Platform at a Glance

Solserva brings every after-sales activity into five integrated modules. Each module works on its own and shares data with the others, so information captured once is available everywhere.

No.	Module	What it delivers
1	**Customer Directory & Multi-Site Plant Management**	One structured record for every client, plant and document.
2	**QR Code Service Intake**	Customers report faults in seconds — no app, no login.
3	**Service Ticket Lifecycle Management**	Full accountability from complaint to closure, with SLA control.
4	**AMC & Contract Renewal Automation**	Protects recurring revenue with automatic renewal alerts.
5	**Field Operations & Digital Service Reports**	Smart dispatch, mobile reporting and digital sign-off.

Who Solserva Serves

- **Solar EPC companies** – managing post-commissioning service for residential, commercial and industrial customers.
- **O&M contractors** – running preventive and corrective maintenance across distributed portfolios.
- **Field service enterprises** – coordinating technicians, tickets and service contracts at scale.

3 Module Specifications

The following pages describe the capabilities of each Solserva module in detail.

MODULE 1

Customer Directory & Multi-Site Plant Management

Replace fragmented records with one secure, structured enterprise database.

Unified CRM & Client Hierarchy

- Stores complete client profiles, including corporate structure, billing entities, primary contacts and communication preferences.
- Maintains a full audit trail of every interaction, service event and commercial transaction, mapped directly to the client account.

Multi-Site & Distributed Asset Mapping

- Designed for C&I and residential solar portfolios in which one client owns or manages multiple rooftop installations, ground-mounted farms or utility substations across different regions.
- Each physical location is recorded as a distinct "Plant" linked to the parent client profile.

Digital Document Vault

- A centralised cloud repository that eliminates physical paperwork.
- Securely stores commissioning certificates, SLDs, inverter serial numbers, module warranty cards, net-metering documents and installation handover sign-offs against the specific plant record.

MODULE 2

Frictionless QR Code Service Intake

A faster complaint experience for customers — with zero adoption barriers.

Plant-Level QR Deployment

- Solserva generates a unique, encrypted QR code sticker for every registered plant.
- EPCs fix these weather-resistant stickers to the inverter chassis, distribution board or main plant entry gate.

No App Download, No Login

- When a plant underperforms, shows an error code or develops a fault, the homeowner, tenant or site supervisor simply scans the QR code with a standard smartphone camera.
- The scan opens a lightweight, mobile-optimised web form for that exact plant — no app installation, user registration or password required.

Rich Media Fault Capture

- The form guides the user to select a symptom category (for example Inverter Tripped, Low Generation, Meter Fault or Physical Damage), add a short description and attach live photos or error screenshots.
- On submission, the system validates the location data, creates a high-priority ticket and assigns it to the operations desk in real time.

How it works

Scan the QR code → Describe the fault & add photos → Ticket created & assigned instantly

Solserva Stick Logger with QR label installed alongside DC and AC distribution boxes

MODULE 3

End-to-End Service Ticket Lifecycle Management

Complete operational accountability, from first complaint to final sign-off.

Configurable Status Workflows

- Every issue moves through a clear, transparent lifecycle:

Open	→ Assigned	→ In Progress	→ Resolved	→ Closed

- Configurable triggers send automatic notifications by SMS, email or WhatsApp at every status change.

Priority Matrix & SLA Management

- Classifies issues by severity: Low, Medium, High and Critical.
- Critical failures — such as a complete commercial inverter shutdown or a full grid trip — automatically trigger emergency escalation and strict SLA timers to protect client uptime commitments.

Internal Accountability & Handover Logs

- Every ticket permanently records who logged the complaint, which manager assigned it, which field engineer accepted it, and the root cause and corrective actions taken.

Solserva Stick Logger field units

MODULE 4

AMC & Contract Renewal Automation

Protect, defend and grow your recurring maintenance revenue.

Real-Time Contract Health Dashboard

- Gives management a live view of active, upcoming and expired maintenance contracts across the entire client portfolio.

Proactive Expiry & Renewal Alerts

- Eliminates manual tracking errors. The automated engine sends multi-stage alerts to your sales and account management teams 60, 30 and 15 days before an AMC lapses.

60	30	15
days before expiry	days before expiry	days before expiry

Preventive Maintenance (PM) Schedule Mapping

- Links each active AMC to its scheduled service intervals (for example quarterly panel-cleaning checks or half-yearly inverter thermal-imaging audits) and automatically creates recurring field tasks — before the customer has to ask.

MODULE 5

Field Operations & Digital Service Reports (DSR)

Seamlessly connect the back office with technicians on the ground.

Smart Field Dispatch & Geo-Assignment

- Operations managers assign tickets and maintenance jobs to field engineers based on geographic proximity, schedule availability and technical skill set.

Mobile Digital Service Reports

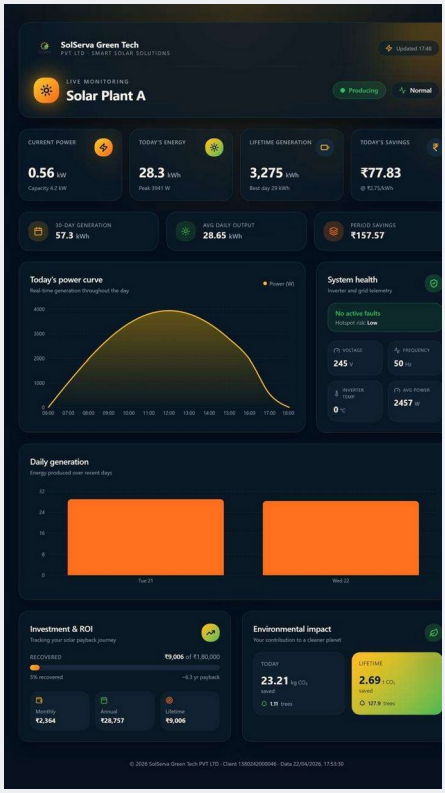

- Field engineers use mobile devices to log diagnostics, record inverter and energy-meter readings, upload panel-cleaning verification photos and record spare parts replaced (for example DC cables, MC4 connectors and AC breakers).

Digital Customer Sign-Off

- On completion, the technician captures the site manager's digital signature on the mobile screen, closes the ticket and instantly emails a certified Digital Service Report to the client.

Role-Based Access Control (RBAC)

- Granular permissions ensure business owners have full financial visibility, managers control workflows, and field technicians see only their assigned jobs.

Plant monitoring dashboard and remote access views

4 Subscription Plans

Solserva operates on a flexible, scalable SaaS subscription model that grows with your business volume and asset portfolio. Start with a free pilot and upgrade as your operations expand.

Feature	Free Tier (Pilot)	Starter Plan	Growth Plan	Enterprise Edition
Primary target use	Small evaluations & testing	Daily service operations	Scaling teams with automation	Large-scale solar enterprises & utilities
Asset / plant limit	Up to 100 assets	Scaled limits	Up to 500 assets	Custom / unlimited assets
User seats included	Up to 3 users	Standard team access	Up to 10 users	Custom multi-user matrix
Service tickets	15 tickets / month	Standard volume	Advanced volume	Unlimited tickets
AMC contract tracking	Up to 2 contracts	Included	Included	Custom terms & multi-tier SLAs
QR code service intake	Included	Included	Included	Custom-branded workflows
Workflow automation	Basic dashboard	Standard tracking	WhatsApp-ready & auto-alerts	Advanced custom integrations
Support & account level	Standard email	Standard support	Priority support	Dedicated account manager

Flexible billing

Monthly, half-yearly and annual billing options are available, with significant savings on annual upfront billing.

Contact us for current pricing and a tailored quotation.

5 Technology Roadmap

Solserva is built as a modular, API-first ecosystem, designed for continuous expansion into adjacent operational lifecycles. The following capabilities are on our development roadmap:

Sales Pipeline & Lead Management

- Moves prospective clients seamlessly from site survey, solar shadow analysis and commercial quotation to project handover and asset creation.

Advanced Telemetry & Hardware Monitoring Integration

- Direct API and IoT hardware integrations (inverter protocols such as Modbus and SunSpec) for real-time generation analytics, string-level performance monitoring, automated yield-drop alerts and instant fault-ticket creation.

Executive Business Intelligence (BI) Analytics Suite

- Executive dashboards analysing financial metrics, technician efficiency, spare-parts consumption and lifecycle asset profitability.

Thermal Drone Scanning — Coming Soon

- Drone-based thermal scanning of solar arrays.

Thermal drone scanning (coming soon)

6 Value for Every Stakeholder

Solar EPC business owners	Cuts post-commissioning administrative coordination time by up to 70%, eliminates revenue leakage through automated AMC renewal tracking, and scales operations without a proportional rise in overhead costs.
Service & operations managers	Removes blame-shifting and communication gaps between office coordinators and field engineers through transparent, tamper-proof ticket logs and live status tracking.
End-customers (homeowners & C&I facility managers)	A modern, effortless after-sales experience: no passwords, no app downloads and instant fault reporting by QR code.
